

# QUALITY REPORT FOR STATISTICAL SURVEY STRUCTURAL BUSINESS STATISTICS

FOR 2023

Report prepared by: Bojana Cicović  
Date: APRIL 2026

## TABLE OF CONTENTS

1	STATISTICAL PROCESS AND STATISTICAL OUTPUTS	5
1.1	The purpose of the survey	5
1.2	Legal basis and responsibility of statistical institutions	5
1.3	Classifications used	5
1.4	Reporting unit	5
1.5	Statistical observation unit	5
1.6	Coverage	5
1.7	Statistical concepts and definitions	6
2	RELEVANCE	6
2.1	The users of statistical survey data	6
2.1.1	The users of statistical data	6
2.1.2	Assessment of the user's needs	7
2.1.3	Assessment of the perception and user satisfaction	7
2.2	Completeness of data	7
2.2.1	<u>Quality and performance indicators - Data completeness rate (R1)</u>	7
3	THE ACCURACY AND RELIABILITY	7
3.1	The sampling errors	7
3.1.1	<u>Quality and performance indicators - Sampling error (A1)</u>	7
3.1.2	Activities to reduce the sampling errors	7
3.2	Non-sampling errors	7
3.2.1	Non-sampling errors - Coverage errors	7
3.2.1.1	<u>Quality and performance indicators - Over-coverage rate (A2)</u>	8
3.2.1.2	<u>Quality and performance indicators - Joint units share (A3)</u>	8
3.2.1.3	Errors of under-coverage	8
3.2.1.4	Measures to reduce coverage errors	8
3.2.2	Non-sampling errors - Errors of measurement	8
3.2.2.1	The reasons for the occurrence of errors of measurement	8
3.2.2.2	Measures to reduce the number of errors of measurement	9
3.2.3	Non-sampling errors – Non-response errors	9
3.2.3.1	<u>Non-sampling errors – Non-response errors</u>	9
3.2.3.2	<u>Quality and performance indicators - Item non-response rate (A5)</u>	9
3.2.3.3	Procedures in the case of non-response	9
3.2.3.4	Methods for reducing of non-response rate	
3.2.4	Imputation	9
3.2.4.1	<u>Quality and performance indicators - Imputation rate (A7)</u>	9
3.2.5	Revisions	10
3.2.5.1	<u>Quality and performance indicators - Average size of data revision (A6)</u>	10
4	TIMELINESS AND PUNCTUALITY	10
4.1	Timeliness of publishing	10
4.1.1	<u>Quality and performance indicators - Time lag of first results (TP1)</u>	10
4.1.2	<u>Quality and performance indicators - Time lag of final results (TP2)</u>	10

4.2	Publishing punctuality	10
4.2.1	<u>Quality and performance indicators – Publishing punctuality (TP3)</u>	10
4.3	The reasons for the major delays and measures for improvement of the timeliness and punctuality	11
5	COHERENCE AND COMPARABILITY	11
5.1	Coherence	11
5.1.1	<u>Quality and performance indicators – Coherence between different sources (CH1)</u>	11
5.1.2	The reasons for the significant deviations	11
5.2	Comparability	11
5.2.1	<u>Quality and performance indicators–Asymmetry for mirror flows statistics–coeff.(CC1)</u>	11
5.2.2.	<u>Quality and performance indicators - Length of comparable time series (CC2)</u>	11
5.2.3	Interruptions in the time series	12
5.3	Geographical comparability	12
5.3.1	Comparability with other members of the European Statistical System	12
6	ACCESSIBILITY AND CLARITY, DISSEMINATION FORMAT	12
6.1	Press releases with published data	12
6.2	Publications with published data	12
6.3	On – line database	13
6.4	Access to microdata	13
6.5	Accessibility of methodological documentation	13
6.6	Measures to improve the user-friendliness	13
6.7	<u>Quality and performance indicators – Data tables consultation (AC1)</u>	13
6.8	<u>Quality and performance indicators – Metadata consultation (AC2)</u>	13
6.9	<u>Quality and performance indicators – Metadata completeness rate (AC3)</u>	13
7	SURVEY COSTS AND RESPONDENTS BURDEN	13
7.1	Costs of statistical survey	13
7.2	Respondents burden	14
7.3	Measures to reduce the costs and burdens	14
8	CONFIDENTIALITY	14
8.1	Confidentiality - Policy	14
8.2	Confidentiality - Treatment of data	14
9	STATISTICAL PROCESSING	15
9.1	Data source	15
9.2	The frequency of data collection	15
9.3	Data collection	15
9.4	Data validation	15
9.5	Data compilation	16
9.6	Adjustments	16
9.6.1	Seasonal adjustments	16

## 1 STATISTICAL PROCESS AND STATISTICAL OUTPUTS

### 1.1 The purpose of the survey

The purpose of Structural Business Statistics (SBS) is to monitor the operations of market producers and providing the data according to European standards. Structural business statistics data are used for analysis of business entities' structure by activities (production value, value added, employment, etc.), analysis of factors used in production process (number of persons employed, compensation of employees, investments etc.), analysis of national and regional development. Also, structural business statistics data represent significant inputs for calculation of aggregates in national accounts and calculation of weights for index calculation in short-term statistics.

### 1.2 Legal basis and responsibility of statistical institutions

Legal basis for structural business statistics implementation are: Four-year Program of statistical activities of Bosnia and Herzegovina, Annual Work Plan of the Agency for Statistics which are adopted based on the Law on Statistics in BiH ("Official Gazette of BiH" no. 26/04 and 42/04), law on statistics of entity institutes, their plans and programs. In the European Union, Structural business statistics are regulated by the elementary EU Regulation for Business Statistics 2019/2152 and the Implementing regulation 2020/1197.

### 1.3 Classifications used

Structural business statistics results are shown according to the Classification of Activities - KD BiH 2010, which is completely harmonized with EU classification of Economic Activities NACE Rev. 2.

### 1.4 Reporting unit

Reporting unit for the survey which is conducted for enterprises with 20 and more persons employed is an enterprise (legal person), while for the entrepreneurs (natural persons) the variables are estimated.

### 1.5 Statistical observation unit

Observation units are active enterprises and entrepreneurs from non-financial business economy.

### 1.6 Coverage

Active market enterprises as well as entrepreneurs from Statistical business register (SBR) are covered that are, according to their main activities, categorized into the following sections of activities: B – Mining and quarrying, C – Manufacturing, D – Electricity, gas, steam and air conditioning supply, E – Water supply; sewerage, waste management and remediation activities, F – Construction, G – Wholesale and retail trade; repair of motor vehicles and motorcycles, H –

Transportation and storage, I – Accommodation and food service activities (Hotels and restaurants), J – Information and communication, L – Real estate activities, M – Professional, scientific and technical activities, N – Administrative and support service activities, P – Education, Q – Human health and social work activities, R – Arts, entertainment and recreation , S – Other service activities, except 94 – Activities of membership organizations.

### 1.7 Statistical concepts and definitions

Concepts and definitions used in structural business statistics are completely harmonized with concepts and definitions applied in EU, Regulation for Business Statistics 2019/2152 and the Implementing regulation 2020/1197.

*Number of enterprises* include market enterprises registered to the population concerned in the Statistical business register. Only active units which either had turnover or employment at any time during the reference period should be included. Dormant (temporarily inactive) and inactive units are excluded.

*Number of entrepreneurs* include market entrepreneurs registered to the population concerned in the Statistical business register i.e. entrepreneurs that had employment data from Unique System of Registration, Control and Collection of Contributions.

*The number of persons employed* is defined as the total number of persons who work in the observation unit (including working proprietors, partners working regularly in the unit and unpaid family workers working regularly in the unit), as well as persons who work outside the unit who belong to it and are paid by it (e.g. sales representatives, delivery personnel, repair and maintenance teams).

*Turnover* comprises revenues calculated from sales of products, goods and services by the observation unit to third parties during the reference period, without VAT and similar deductible taxes. Sales discounts, price reductions, value of returned goods, as well as subsidies received from the state, other, financial and extraordinary incomes are excluded.

*Value added at factor cost* is the gross income from operating activities after adjusting for operating subsidies and indirect taxes.

*Personnel costs* are defined as the total remuneration, in cash or in kind, payable by an employer to an employee (regular and temporary employees as well as home workers) in return for work done by the latter during the reference period.

## 2 RELEVANCE

### 2.1 Users of statistical survey data

#### 2.1.1 Key users of statistical survey data

Key data users of structural business statistics are:

External users: Eurostat, ministries and authorities, researchers, journalists, business entities and international institutions;

Internal users: Statistical business register, Short-term business statistics.

### *2.1.2 Assessment of users' needs*

Structural business statistics data are used for analysis of business operations of enterprises and entrepreneurs, analysis of factors used in production process as well as the analysis of competitiveness and development.

### *2.1.3 Assessment of the perception and user satisfaction*

There is no user satisfaction survey dedicated to presented results of SBS. Agency for Statistics conducted Users' satisfaction survey of all statistics. Results of Users' satisfaction survey are available on the web page: <https://bhas.gov.ba>

## 2.2 Completeness of data

### *2.2.1 Data completeness rate (R1)*

The rate of structural business statistics data completeness is 100%. Data obtained by structural business statistics enable calculation of all variables which are required by Regulation 2019/2152.

## 3 THE ACCURACY AND CLARITY

### 3.1 Sampling errors

Data for compilation of structural business variables and indicators are collected through statistical survey "Annual structural business statistical survey for enterprises" with 20 and more persons employed and for other active enterprises the data are obtained from administrative data sources of the entities and Brčko District. Variables for entrepreneurs are estimated based on entrepreneurs' employment data, which are taken from Statistical business register and structural business data for enterprises.

#### *3.1.1 Sampling error (A1)*

It is not possible to calculate sampling errors, because the production of structural business statistics is not based on random sample.

#### *3.1.2 Activities to reduce the sampling errors*

This indicator is not applicable.

### 3.2 Non-sampling errors

#### *3.2.1 Non-sampling errors - Coverage errors*

Coverage error (or frame error) appears due to differences between the population covered by frame and the target population.

### *3.2.1.1 Over- coverage rate (A2)*

Over-coverage rate appears in a situation when the frame includes enterprises which are not subject of structural business statistics observing, according to methodology. Since the structural business statistics frame is based on Statistical business register which contains the data on main activity for the reference year, this case is rare. From the aspect of enterprise activity, over-coverage rate occurs if the survey includes enterprises that are subsequently found not to be active.

### *3.2.1.2 Joint units share (A3)*

Data from three sources are combined for production of structural business statistics: survey for enterprises with 20 and more persons employed, administrative data sources for other enterprises and estimation for entrepreneurs. Data for each unit are obtained from one source only, i.e. there are no joint units which are included in more sources.

### *3.2.1.3 Errors of under-coverage*

Under-coverage is present in cases when the unit is not included in the frame, although it belongs to the structural business statistics frame, according to the methodology. It is rarely the case that the enterprise was active in the reference year without submitting its annual financial statements.

### *3.2.1.4 Measures to reduce coverage errors*

Basic measures to reduce coverage errors include regular updates of Statistical business register.

## *3.2.2 Non-sampling errors - Errors of measurement*

A set of control has been included in IT application for data entry from the survey for enterprises with 20 and more persons employed, which is used to check completeness, accuracy and logic of data on the level of basic subject. Data obtained from administrative data sources are also controlled by logical and computing controls.

### *3.2.2.1 The reasons for the occurrence of errors of measurement*

The most common reasons for the occurrence of measurement errors are:

- Lack of skills of person who fills the questionnaire;
- Person filling the questionnaire has not read the instructions carefully;
- Accidental mistakes in filling the data.

### *3.2.2.2 Measures to reduce the number of errors of measurement*

If applying computing and logical controls leads to detection of errors on data obtained from both sources, i.e. survey and from administrative data sources, the errors are corrected through contact with reporting unit or by using the other statistical surveys. After that, the statistical analysis of variables and indicators is performed, which results in determining extreme values (outliers), which are listed and checked.

The most important instrument for reducing errors on data which comes from the survey is precise and understandable methodological explanations. Due to that reason, Instructions for filling the questionnaire are sent to each reporting unit which describes in detail the way of filling the questionnaire. In case additional explanation is needed, the letter to the reporting units contains the contact details of the person responsible for the survey, who can be contacted by each reporting unit.

### *3.2.3 Non-sampling errors – Non-response errors*

#### *3.2.3.1 Units non-response rate (A4)*

Non-response rate of reporting units which come from the survey for enterprises with 20 and more persons employed is 21.4%. During data processing, this rate is corrected by taking data from administrative data sources for enterprises that were in the survey but did not respond.

#### *3.2.3.2 Item non-response rate (A5)*

The information which enables the calculation of this rate is not available.

#### *3.2.3.3 Procedures in the case of non-response*

If the responses on certain questions are missing for the reporting units included in the survey, contact with the reporting unit will be established again, and if necessary, the missing values will be supplemented. If the contact with the reporting unit is not established, data are corrected based on data from the annual financial statements, data for the previous year or from other statistical surveys. In case a complete report is missing, the data are taken from administrative data sources. Data which originate from administrative data sources are edited.

#### *3.2.3.4 Methods for reducing the rate of non-response*

In order to decrease the non-response rate for part of enterprises which originate from survey, the enterprises are contacted by telephone and the questionnaires are sent again via e-mail.

### *3.2.4 Imputation*

#### *3.2.4.1 Imputation rate (A7)*

Information which enables calculation of this rate is not available.

### 3.2.5 Revisions

#### 3.2.5.1 Average size of data revisions (A6)

Structural business statistics data are published two times per year, as preliminary and final data. The revision of final data has not been done.

## 4 TIMELINESS AND PUNCTUALITY OF PUBLISHING

### 4.1 Timeliness

#### 4.1.1 Time lag of first results (TP1)

Reference period	<b>01.01-31.12.2023.</b>
Date of publishing of the first results	20.11.2024.
Time gap (number of months)	T+11

Timeliness of publishing of preliminary results is T + 11 months.

#### 4.1.2 Time lag of final results (TP2)

Reference period	<b>01.01-31.12.2023.</b>
Date of publishing of the final results	30.06.2025.
Time gap (number of months)	T+18

Timeliness of publishing of final results is T + 18 months.

### 4.2 Publishing punctuality

#### 4.2.1 Publishing punctuality (TP3)

This indicator is calculated and shown in two ways – from aspect of application for producers of statistics or the users of statistics.

#### *Indicator for producers of statistics*

Reference period	<b>01.01-31.12.2023.</b>
Expected date of publishing	30.06.2025.
Actual date of publishing	30.06.2025.
Time gap (number of days)	T+0

Punctuality of publishing is T + 0 days.

#### *Indicator for statistics users*

Punctuality rate of publishing the data for the structural business statistics is 100%.

#### 4.3 The reasons for the major delays and measures to improve the timeliness and punctuality

The final results were published timely. There was no delay between the announced and the actual publication dates.

## 5 COHERENCE AND COMPARABILITY

### 5.1 Coherence

#### *5.1.1 Coherence between different sources, coeff.(CH1)*

Structural business statistics data are compared to data from other statistics, such as national accounts data, PRODCOM statistics, employment statistics etc.

#### *5.1.2 The reasons for the major delays*

Full comparability is not possible because of different definitions of certain variables, value added at factor costs in SBS and in the national accounts at basic prices, different coverage of sector (SBS covers market producers), including the non-observed economy and adjusting it for national accounts needs, sources of data.

### 5.2 Comparability

#### *5.2.1 Asymmetry for mirror flows statistics, coeff. (CC1)*

This indicator is not applicable in structural business statistics.

#### *5.2.2 Length of comparable time series (CC2)*

The structural business statistics for Bosnia and Herzegovina are regularly produced since 2010. In 2012, the scope was expanded to all sections of non-financial economy. Since 2014 reference year, data for entrepreneurs have been included in structural variables and indicators. Production method for SBS has been changed for reference year 2017, and coverage was expanded to private enterprises and entrepreneurs from section R „Arts, entertainment and recreation“. The length of comparable time series is 7 years.

$$CC2 = (2023 \text{ year} - 2017 \text{ year}) + 1$$

$$CC2 = 7 \text{ years}$$

### 5.2.3 Interruptions in the time series

Data on structural business statistics are not comparable over the years due to expansion of coverage of activities, inclusion of entrepreneurs and change of data production methods. Data for 2012 and 2013 are not comparable to data for 2010 and 2011 due to difference in scope of activity. There was a break in time series in 2014, when entrepreneurs were included, and in 2017, when the data production method was changes and coverage was expanded to section R.

## 5.3 Geographical comparability

### 5.3.1 Comparability with other members of the European Statistical System

Structural business statistics for Bosnia and Herzegovina are produced by application of the same methodology, variables definition and indicators which are harmonized with EU, which creates possibility of making the comparability of SBS data with data from other countries.

## 6 ACCESSIBILITY AND CLARITY, DISSEMINATION FORMAT

### 6.1 Press releases with published data

Preliminary results of structural business statistics are published in annual press release which is available on web page of Agency for Statistics of Bosnia and Herzegovina [www.bhas.gov.ba](http://www.bhas.gov.ba), under name "Structural business statistics – preliminary results for 2023."

([https://bhas.gov.ba/data/Publikacije/Saopštenja/2024/SBS\\_01\\_2023\\_Y1\\_0\\_BS.pdf](https://bhas.gov.ba/data/Publikacije/Saopštenja/2024/SBS_01_2023_Y1_0_BS.pdf))

The press release contains the basic results for enterprises and entrepreneurs, variables and indicators according to sections of activities of KD BiH 2010 (NACE Rev. 2), by enterprise and entrepreneur size. The results are published in tables and graphs and they are shown in absolute values, rates and structures.

### 6.2 Publications with published data

Final results of structural business statistics are published in annual bulletin which is available on web page of Agency for Statistics of Bosnia and Herzegovina [www.bhas.gov.ba](http://www.bhas.gov.ba), under name "Structural business statistics – thematic bulletin".

([https://bhas.gov.ba/data/Publikacije/Bilteni/2025/SBS\\_00\\_2023\\_TB\\_1\\_EN.pdf](https://bhas.gov.ba/data/Publikacije/Bilteni/2025/SBS_00_2023_TB_1_EN.pdf))

The thematic bulletin contains the basic results for enterprises and entrepreneurs, variables and indicators according to sections and divisions of KD BiH 2010 (NACE Rev. 2), by enterprise and entrepreneur size. The results are published in tables and graphs and they are shown in absolute values, rates and structures. Thematic bulletin also contains overview of structural business statistics results for the last three years.

The structural business statistics results are shown in the publication "Bosnia and Herzegovina in figures".

### 6.3 *On – line data base*

On-line data base is available in Excel

[https://bhas.gov.ba/data/Publikacije/VremenskeSerije/SBS\\_01.xls](https://bhas.gov.ba/data/Publikacije/VremenskeSerije/SBS_01.xls)

### 6.4 *Access to microdata*

No microdata is available.

### 6.5 *Accessibility of methodological documentation*

Methodological explanations, as well as definitions of variables and indicators are part of press release and thematic bulletin. Detailed information on structural business statistics can be found in methodological document which is available on web page of Agency for Statistics BiH on following link: [https://bhas.gov.ba/data/Publikacije/Methodologije/SBS\\_00\\_2017\\_MD\\_0\\_EN.pdf](https://bhas.gov.ba/data/Publikacije/Methodologije/SBS_00_2017_MD_0_EN.pdf)

### 6.6 *Measures to improve the user-friendliness*

Data are clearly shown.

### 6.7 *Data set consultations (AC1)*

Information on number of user's consultation in 2023 is not available.

### 6.8 *Metadata consultations (AC2)*

Information on number of consultations of metadata in 2023 is not available.

### 6.9 *Metadata completeness rate (AC3)*

Metadata completeness rate is 100%.

## 7 COSTS AND BURDEN ON RESPONDENTS

### 7.1 Costs of statistical survey conduction

Number of labor hours	6.452 h
Material costs (printing and sending the questionnaires to the field)	3.833 KM
The annual number of forms sent to the reporting units (FBIH i BD)	2738

## 7.2 Respondents burden

Number of respondents that completed form (BiH)	3.209
The time required to complete a questionnaire (hours)	1,0 h
Total used time (hours)	3.209 h

## 7.3 Measures to reduce costs and burdens

For the purpose of rationalization of structural business statistics production, and reduce of response burden, available administrative and other data sources of entities and Brčko District are used since 2017 for enterprises with less than 20 persons employed. Change of production method has led to reduction of production costs as well as reporting unit's response burden.

## 8 CONFIDENTIALITY

### 8.1 Confidentiality - policy

Confidentiality of statistical data is regulated by law and the personnel conducting statistical surveys has the legal obligation to protect confidentiality. Law on Statistics of BiH (Off. Gazette of BiH 26/04 and 42/04 - Chapter XI - Article 23.-29.) establishes the principle of confidentiality as one of the main principles. Agency for Statistics of BiH distributes statistics in line with statistical principles of the European Statistics Code of Practice and in particular with the principle of statistical confidentiality.

### 8.2 Confidentiality – Data treatment

The document "Rulebook on the protection of statistical data in the Agency for Statistics" specifies procedures for ensuring confidentiality during collection, processing and dissemination - including protocols for ensuring access to individual data, rules for defining confidential cells in output tables and procedures for disclosure and prevention of subsequent disclosure, such as and access to microdata for research purposes. By signing the Memorandum of Understanding with the Agency for Statistics of Bosnia and Herzegovina, data users who have access to individual data are obliged to: treat individual anonymous data as confidential in accordance with rules, regulations and procedures, ensure appropriate protection of individual data in accordance with rules, regulations and procedures , protect the transfer of microdata and destroy the medium on which the data are located, as well as the accompanying documentation, five days after the publication of the results.

Confidentiality of statistical data is regulated by Law on Statistics of BiH (data are confidential if they cover less than 3 observation units or if one unit participates in the aggregate with 85% and more). The manual for structural business statistics defines primary and secondary confidentiality. Mark A is used if data cover less than three units, while mark B is mark for one

enterprise with largest share. Secondary confidentiality (mark D) results from the hierarchical structure of the classifications used, as well as combination of data by various classifications.

## 9 STATISTICAL PROCESSING

### 9.1 Data source

Structural business variables of enterprises and entrepreneurs are result of combinations of many data sources, such as: survey for enterprises with 20 and more persons employed, for other enterprises data are obtained from administrative data sources of entities and Brčko District. Data for entrepreneurs are estimated.

### 9.2 Frequency of data collection

Structural business statistics data are collected in annual periodicity.

### 9.3 Data collection

For enterprises with 20 and more persons employed, data are collected by questionnaire "Annual structural business statistical survey for enterprises". In RS, data is collected through a web questionnaire. A detailed questionnaire is created for enterprises with 20 and more persons employed depending on the activity that the enterprise performs. In annual survey for structural business statistics, four main questionnaires are used. Besides the main questionnaires, the additional questionnaires were created for industry and construction, which are used for data collection for kind of activity units. Administrative data sources which are taken for the purpose of calculation of SBS variables are as follows:

- Financial statements (Balance sheet and Income statement)
- Annual investments report for SBS variables on investments.

### 9.4 Data validation

Entry, control and editing of data is performed by entities statistical institutions and Branch office of the Agency in Brčko District.

The application for data entry that is unique to all three statistical institutions has got (built inn) a set of controls for checking the completeness, accuracy and logics of the data at the level of the reporting unit. Errors are corrected through the contact with the reporting unit or by using some other source. After that, the statistical analysis of variables and indicators is performed, through which the extreme values are established (outliers) that are then listed and verified. To determine outliers, the following indicators are used: turnover per person employed, value added per person employed, labor costs per employee, share of gross operating surplus in turnover and share of value added in production value. Administrative data are controlled by logical and computing controls. After that, data editing is done. Also, data validation within the series, in time and between the series is done before data transmission to Eurostat, for the purpose of detection of inconsistent data using EDAMIS application.

## 9.5 Data compilation

Variables for enterprises with 20 and more persons employed are calculated based on data collected by SBS survey and for other enterprises, the variables are calculated based on data from administrative data sources of entities and Brčko District. Special formulas are applied for the calculation of SBS variables, depending on the data source.

Investment variables for all enterprises are calculated based on data from survey "Annual investments report".

Variables for entrepreneurs are estimated based on employment data for entrepreneurs, which are obtained from Statistical business register and structural business data for enterprises.

Estimation of variables for entrepreneurs is done by regression and correlation method. Two coefficients are used: the coefficient of the number of persons employed and the other coefficient is the coefficient of the number of employees. Coefficients are calculated on the group level and by classes of employment. Variables for entrepreneurs are calculated by multiplying the calculated coefficients with enterprise variables on the group level and by classes of employment. The coefficient of the number of employees is used for estimation of personnel costs, while the coefficient of the number of persons employed is used for other variables.

Variables for entrepreneurs are added to the variables of the enterprises. In that way, structural business statistics variables of enterprises and entrepreneurs are obtained.

## 9.6 Adjustments

Adjustment is not applied in structural business statistics.

### *9.6.1 Seasonal adjustment*

Seasonal adjustment is not applied in structural business statistics.
